Question 1

1) prime number $p, q = 7, 11$

secret message = 6.

modulus, $n = p \times q = 77$.

totion function, $\phi(n) = (p-1)(q-1) = 60$

→ Calculating public key 'e':

such that $\{1 < e < \phi(n),$ $gcd(e, \phi(n)) = 1\}$

$\therefore e = 37$

public key = $\{37, 77\}$

→ Calculating private key 'd':

such that $d = \frac{1 + K\,\phi(n)}{n}$, where K is a random number such that 'd' is a whole number

OR

$d \times e \bmod \phi(n) = 1$

$d = \frac{1 + 93 \times 60}{77}$

$d = 73$

private key = $\{73, 77\}$

→ Message '6' encryption.

$= M^e \bmod n = 6^{37} \bmod 60 = 54$

2) prime number $p, q = 11, 13$

Modulus $= n = p \times q = 11 \times 13 = 143$

$\phi(n) = 120$

Let, 'e' be $\rightarrow$ 47.

$\therefore$ public key $= \{47, 143\}$

Let 'd' be

$$d * e \bmod \phi(n) = 1$$

$$\therefore d = 143$$

private key $= \{143, 143\}$

$\therefore$ Encrypted message is $M^e \bmod n$

$$= 9^{47} \bmod 143 = \underline{81}$$

3) prime number $p, q = 17, 31$

Modulus $= 527$

$\phi(n) = 480$

Let 'e' be $\rightarrow 247$.

public key $\{247, 527\}$

$\therefore d \cdot e \bmod \phi(n) = 1$

$\therefore d = 583$

private key $= \{583, 527\}$

$\therefore$ The encrypted message '5' is.

$$5^{247} \bmod 480 = \underline{365}$$

Q2

a) The prime number given 'q' = 13

The primitive root given 'p' = 11

Let 'A' assume values 'x_A' = 6 (private key of 'A')

Let B assume value 'x_B' = 8 (private key of 'B').

The public key of 'A' is "y_A" = $p^{x_A} \bmod q$

$= 11^6 \bmod 13 = 12$

The public key of B is "y_B" = $p^{x_B} \bmod q$.

$= 11^8 \bmod 13$

$= 9.$

PROOF:-

Now A & B will exchange y_A & y_B and decrypt it to see the message.

	A sender	B receiver.
	$(y_B)^{x_A} \bmod q$	$(y_A)^{x_B} \bmod q$
	$(9)^6 \bmod 13$	$(12)^8 \bmod 13$
	$= 1$	$= 1$

Q2

(b) The prime number given 'q' = 17

The primit root given 'p' = 7

Let 'A' assume a private key 'X_A' = 6

Let B assume a private key 'X_B' = 8

The public key of 'A' is 'Y_A' = $(p)^{X_A} \bmod q = (7)^6 \bmod 17 = 9$

The public key of B 'Y_B' = $(p)^{X_B} \bmod q = 16$

PROOF:

A Sender	B Receiver
$(Y_B)^{X_B} \bmod q$	$(Y_A)^{X_B} \bmod q$
$(16)^6 \bmod 17$	$(9)^8 \bmod 17$
1	1

Q2

c) The prime number given 'q' = 17

The primite root given 'p' = 13

let 'A' assume private key 'x_A' = 6

let 'B' assume private key 'x_B' = 8

The public key of A is 'y_A' = $(p)^{x_A} \bmod q = (13)^6 \bmod 17 = 16$

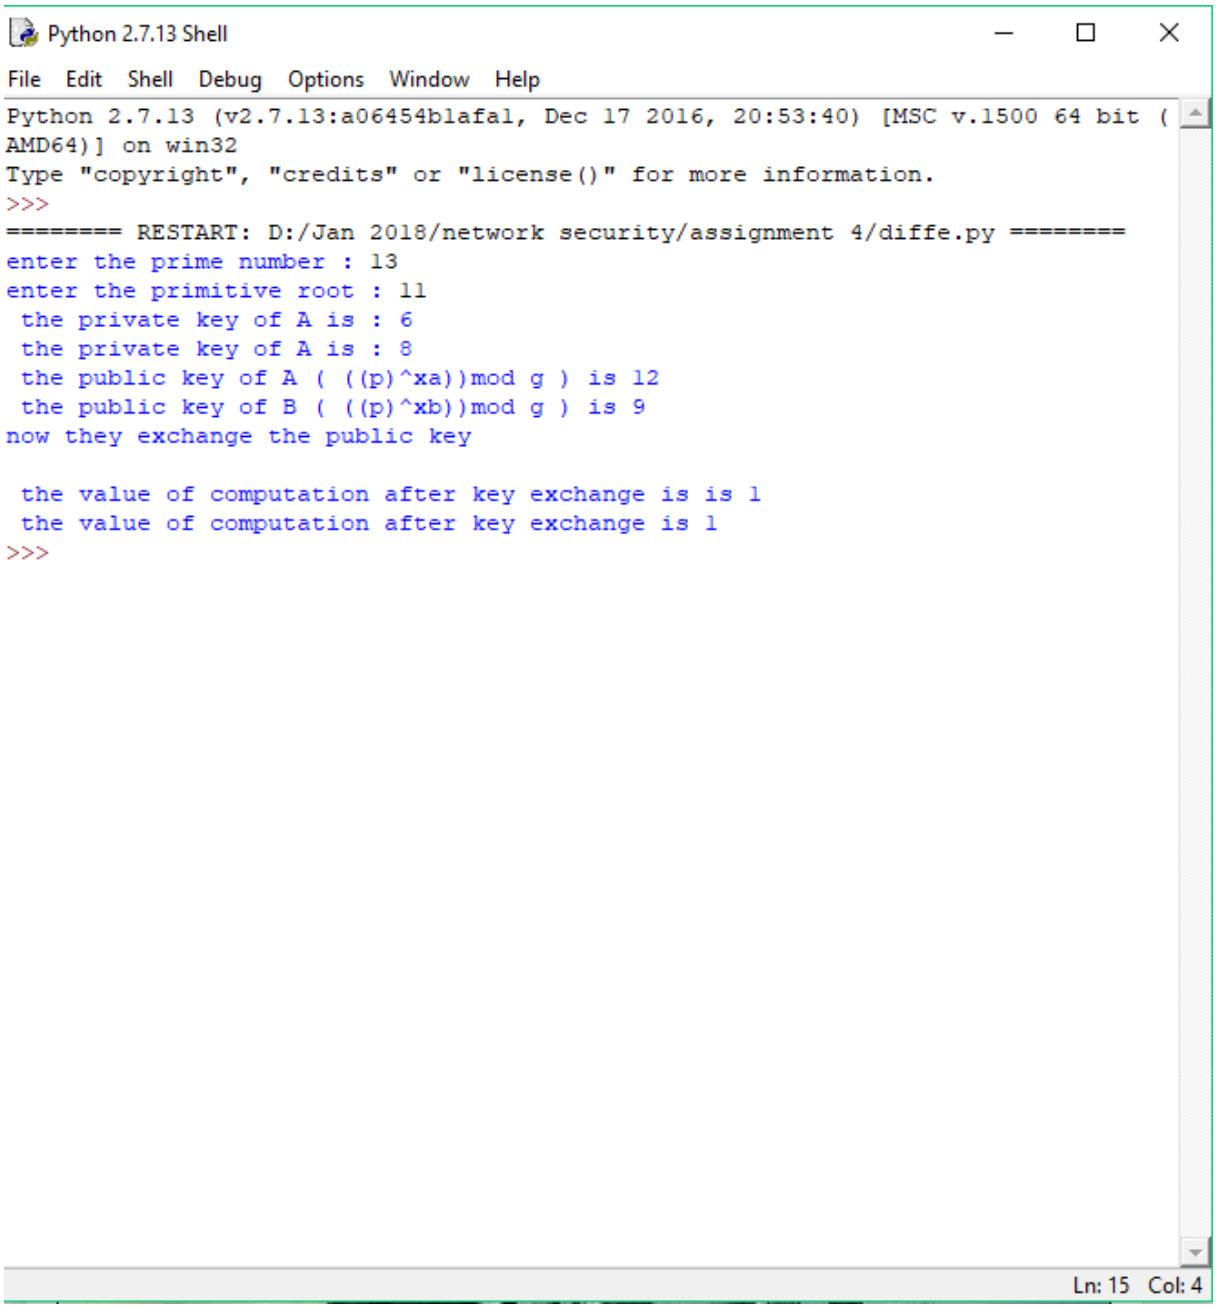
The public key of B is 'y_B' = $(p)^{x_B} \bmod q = (13)^8 \bmod 17 = 1$

PROOF

A Sender	B Receiver
$(y_B)^{x_A} \bmod q$	$(y_A)^{x_B} \bmod q$
$(1)^6 \bmod 17$	$(16)^8 \bmod 17$
1	1

Question 3:

a.



Python 2.7.13 Shell
File Edit Shell Debug Options Window Help
Python 2.7.13 (v2.7.13:a06454blafal, Dec 17 2016, 20:53:40) [MSC v.1500 64 bit (
